## Abstract of the Invention

A sealing arrangement includes a sealing ring (1) having a sealing lip (3) which is curved forward in the direction of the area to be sealed off (2). The sealing lip (3) is pretensioned so as to surround and form a seal around the circumference of the machine element (4) to be sealed off. The sealing lip (3) has, on the side facing radially away from the machine element (4), at least one recess (5). The recess (5) only connects and allows flow between the area to be sealed off (2) and the surrounding area (6) if the sealing ring (1) is incorrectly mounted and the sealing lip (3) is erroneously curved forward in the direction of the surrounding area (6).
